Math 58 Test 3

Spring 2013

(11.8-11.11, 8.1-2)

100 POINTS

10.1 + 10.2

NAME: Solns

No scratch paper. Show all work clearly on test paper. No credit will be given for solutions if work is not shown. Only non-graphing calculators are allowed. Unless otherwise specified, the answer to series questions should be given using sigma notation. Unless otherwise stated, you do not need to find the radius of convergence.

(1) FIND THE INTERVAL OF CONVERGENCE FOR EACH OF THE FOLLOWING. (5 points each) Use Ratio Test.

$$(a) \sum_{n=1}^{\infty} \frac{2^n (x+3)^n}{\sqrt{n}}$$

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right|$$

$$= \lim_{n \rightarrow \infty} \left| \frac{2^{n+1} (x+3)^{n+1}}{\sqrt{n+1}} \cdot \frac{\sqrt{n}}{2^n (x+3)^n} \right|$$

$$= \lim_{n \rightarrow \infty} 2|x+3| \frac{\sqrt{n}}{\sqrt{n+1}} = 2|x+3| \cdot 1$$

Series converges absolutely when

$$2|x+3| < 1$$

$$\Rightarrow |x+3| < \frac{1}{2} \Rightarrow -\frac{7}{2} < x < -\frac{5}{2}$$

$$(b) \sum_{n=1}^{\infty} \frac{n^2 x^n}{2 \cdot 4 \cdot 6 \cdots (2n)}$$

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{(n+1)^2 x^{n+1}}{2 \cdot 4 \cdot 6 \cdots 2(n+1)} \cdot \frac{2 \cdot 4 \cdots 2n}{n^2 x^n} \right|$$

$$= \lim_{n \rightarrow \infty} \left| \frac{(n+1)^2 |x|}{(2n+2) n^2} \right| = 0 \text{ for all } x. \quad (-\infty, \infty)$$

$$(c) \sum_{n=1}^{\infty} \frac{n!}{3^n} (x+4)^n$$

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{(n+1)! (x+4)^{n+1}}{3^{n+1}} \cdot \frac{3^n}{n! (x+4)^n} \right|$$

$$= \lim_{n \rightarrow \infty} \frac{n+1}{3} |x+4| = \infty \text{ unless } x = -4$$

Converges for  $x = -4$  only

Need

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| < 1$$

Check endpts: weee =

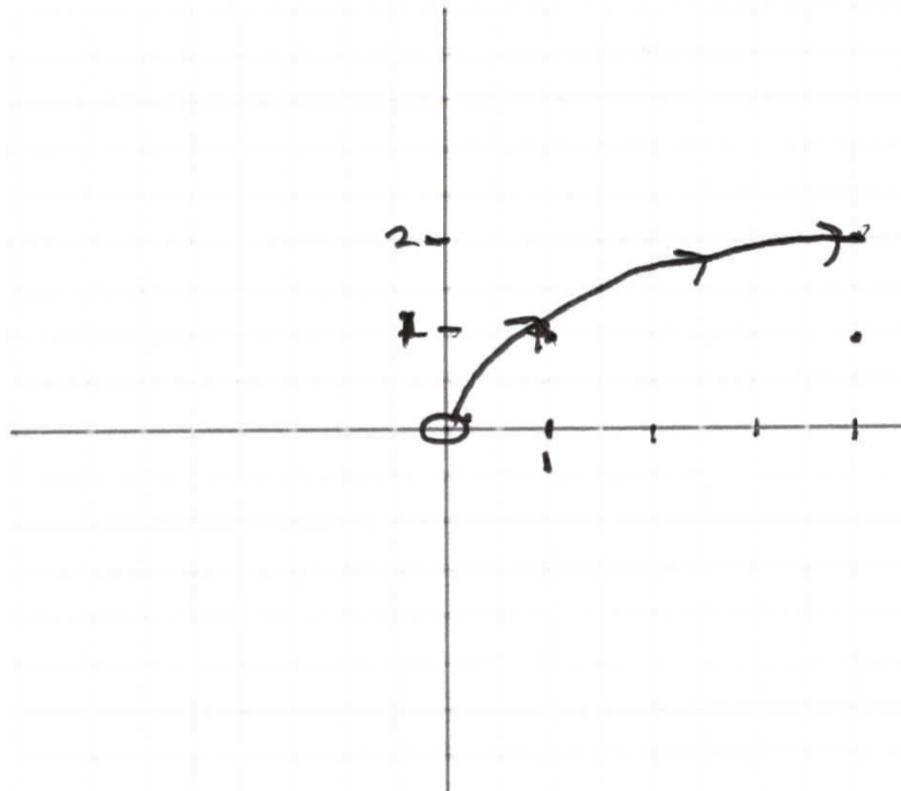

Check endpoints

$$x = -\frac{7}{2} \quad \sum_{n=0}^{\infty} \frac{2^n (-\frac{1}{2})^n}{\sqrt{n}} = \sum_{n=0}^{\infty} \frac{(-1)^n}{\sqrt{n}} \text{ conv. by A1}$$

$$x = -\frac{5}{2} \quad \sum_{n=0}^{\infty} \frac{2^n (\frac{1}{2})^n}{\sqrt{n}} = \sum_{n=0}^{\infty} \frac{1}{\sqrt{n}} \text{ div } p = \frac{1}{2}$$

Answer:  $\boxed{[-\frac{7}{2}, -\frac{5}{2}]}$

- (2) Eliminate the parameter and sketch the curve, showing direction of increasing  $t$ .  $\begin{cases} x = e^{2t} \\ y = e^t \end{cases}$  (10 points)

$$x = (e^t)^2$$

$$x = y^2$$

$$\text{But } e^t > 0$$

$$\text{so } x > 0$$

$$y > 0$$

$$\text{As } t \rightarrow -\infty, x \rightarrow 0$$

)

- (3) Find the Maclaurin series for  $f(x) = \cos 2x$  directly, using the definition. - know how to do it

and no substitution

(10 points)

$$f(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(0)}{n!} x^n = f(0) + \frac{f'(0)}{1!} x + \frac{f''(0)}{2!} x^2 + \dots$$

Find  $f^{(n)}(0)$

$$f(x) = \cos 2x \quad f(0) = 1$$

$$f'(x) = -\sin 2x \cdot 2 \quad f'(0) = 0$$

$$f''(x) = -\cos 2x \cdot 2^2 \quad f''(0) = -2^2$$

$$f'''(x) = \sin 2x \cdot 2^3 \quad f'''(0) = 0$$

$$f^{(4)}(x) = \cos 2x \cdot 2^4 \quad f^{(4)}(0) = 2^4$$

Cannot write general term  
for  $f^{(n)}(0)$  easily so  
write some terms

$$\cos 2x = 1 + 0x - \frac{2^2}{2!} x^2 + 0x^3 + \frac{2^4}{4!} x^4 + \dots$$

$$\cos 2x = 1 - \frac{2^2}{2!} x^2 + \frac{2^4}{4!} x^4 + \dots$$

$$\cos 2x = \sum_{n=0}^{\infty} \frac{2^n x^{2n}}{(2n)!} \cdot (-1)^n$$

Note: easy to check using  
know formula  
 $\cos x = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n}}{(2n)!}$

And substitute  $2x$  for  $x$ .

(4) Find the Maclaurin series for  $x^4 e^{x^3}$

(5 points)

(There are easy ways and there are hard ways this can be done)

Know  $e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!}$  for all  $x$

Substitute  
 $x^3$  for  $x$

$$e^{x^3} = \sum_{n=0}^{\infty} \frac{(x^3)^n}{n!} = \sum_{n=0}^{\infty} \frac{x^{3n}}{n!} \text{ for all } x$$

Mult. by  $x^4$

$$x^4 e^{x^3} = \sum_{n=0}^{\infty} \frac{x^{3n}}{n!} \cdot x^4 = \sum_{n=0}^{\infty} \frac{x^{3n+4}}{n!} \text{ for all } x$$

—————

(5) Find the Taylor series for  $f(x) = 1/x^2$  centered at  $a=2$ . (Assume that  $f$  has a power series expansion.)

(10 points)

$$f(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(a)}{n!} (x-a)^n = \sum_{n=0}^{\infty} \frac{f^{(n)}(2)}{n!} (x-2)^n$$

Find  $f^{(n)}(2)$

$$f(x) = x^{-2}$$

$$f'(x) = -2x^{-3}$$

$$f''(x) = 3 \cdot 2x^{-4}$$

$$f'''(x) = -4 \cdot 3 \cdot 2x^{-5}$$

$$\vdots$$

$$f^{(n)}(x) = (-1)^n (n+1)! x^{-(n+2)}$$

so

$$f^{(n)}(2) = \frac{(-1)^n (n+1)!}{2^{n+2}}$$

$$= \sum_{n=0}^{\infty} \frac{(-1)^n (n+1)!}{2^{n+2} n!} (x-2)^n$$

$$= \sum_{n=0}^{\infty} \frac{(-1)^n (n+1)}{2^{n+2}} (x-2)^n$$

—————

(6) Find the length of the curve  $y=x^{2/3}$  from  $(1,1)$  to  $(2\sqrt{2}, 2)$

$$L = \int_a^b \sqrt{1 + \left(\frac{dy}{dx}\right)^2} dx \quad \text{OR} \quad L = \int_a^b \sqrt{1 + \left(\frac{dx}{dy}\right)^2} dy \quad (10 \text{ points})$$

$$y = x^{2/3} \quad y' = \frac{2}{3}x^{-1/3}$$

$$x = y^{3/2} \quad x' = \frac{3}{2}y^{1/2}$$

$$L = \int_1^{2\sqrt{2}} \left(1 + \frac{4}{9x^{2/3}}\right) dx = \int_1^{2\sqrt{2}} \frac{9x^{2/3} + 4}{9x^{1/3}} dx$$

$$u = 9x^{2/3} + 4$$

$$du = 6x^{-1/3} dx$$

$$\frac{1}{18} \int_{13}^{22} u^{1/2} du = \frac{1}{27} u^{3/2} \Big|_{13}^{22} = \frac{1}{27} \left(22^{3/2} - 13^{3/2}\right)$$

$$L = \int_1^2 \sqrt{1 + \frac{9}{4}y} dy \quad u = 1 + \frac{9}{4}y$$

$$du = \frac{9}{4} dy$$

$$\frac{8}{27} \int_{13/4}^{43/4} u^{1/2} du = \frac{8}{27} \left((\frac{43}{4})^{3/2} - (\frac{13}{4})^{3/2}\right)$$

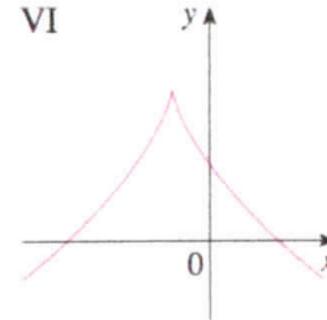

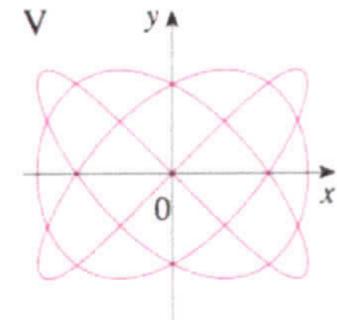

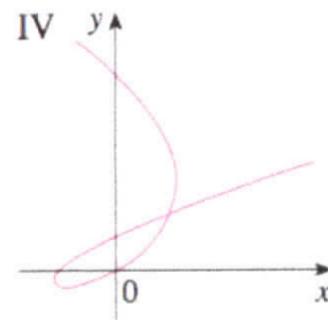

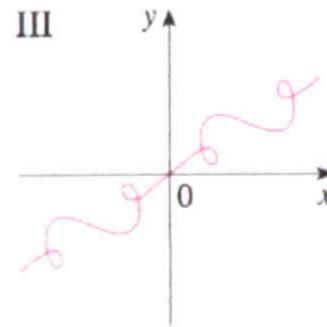

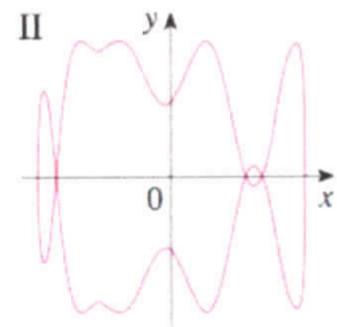

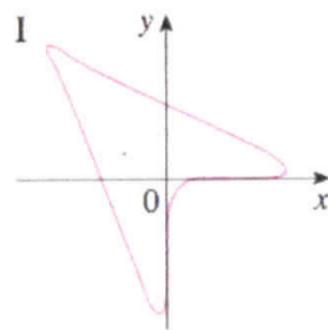

(7)

(10 points)

24. Match the parametric equations with the graphs labeled

I–VI. Give reasons for your choices. (Do not use a graphing device.)

- IV** (a)  $x = t^3 - 2t$ ,  $y = t^2 - t$   
**VII** (b)  $x = t^3 - 1$ ,  $y = 2 - t^2$   
**V** (c)  $x = \sin 3t$ ,  $y = \sin 4t$   
**III** (d)  $x = t + \sin 2t$ ,  $y = t + \sin 3t$   
**I** (e)  $x = \sin(t + \sin t)$ ,  $y = \cos(t + \cos t)$   
**II** (f)  $x = \cos t$ ,  $y = \sin(t + \sin 5t)$

- (8) Using the geometric series for  $\frac{1}{1-x}$  find a power series representation for  $\frac{3x}{1+2x}$  and determine the radius of convergence.

(10 points)

$$\frac{5x}{1+3x} = 5x \cdot \frac{1}{1-(-3x)}$$

Substitute  $-3x$  for  $x$

$$\frac{1}{1+3x} = \sum_{n=0}^{\infty} (-3x)^n \quad |3x| < 1 \Rightarrow R/3$$

Mult by  $5x$

$$\frac{5x}{1+3x} = 5 \sum_{n=0}^{\infty} (-3)^n x^{n+1} \quad |x| < \frac{R}{3}$$

$\uparrow$   
radius's

- (9) Use series to compute  $\int_0^{1/2} x^2 e^{-x^2} dx$  with  $\text{error} < 0.0001$

(10 points)

(with minimal # terms)

$$e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!} \quad \text{for all } x$$

$$e^{-x^2} = \sum_{n=0}^{\infty} \frac{(-x^2)^n}{n!} = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n}}{n!} \quad \text{for all } x$$

$$x^2 e^{-x^2} = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+2}}{n!} \quad \text{for all } x$$

$$\int_0^{V_2} x^2 e^{-x^2} dx = \int_0^{V_2} \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+2}}{n!} dx = \left[ \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+3}}{(2n+3)n!} \right]_0^{V_2} \quad \text{for all } x$$

$$= \sum_{n=0}^{\infty} \frac{(-1)^n (\frac{1}{2})^{2n+3}}{(2n+3)n!} = \sum_{n=0}^{\infty} \frac{(-1)^n}{2^{2n+3}(2n+3)n!} \quad \boxed{15}$$

$$= \underbrace{\frac{1}{2^3 \cdot 3} - \frac{1}{2^5 \cdot 5} + \frac{1}{2^7 \cdot 7 \cdot 2!} - \frac{1}{2^9 \cdot 9 \cdot 3!}}$$

$\uparrow$   
 $0.00055$

smaller than .001

$$\approx \frac{1}{24} - \frac{1}{160}$$

$$\approx 0.035$$

- (10) 5 (a) Approximate the function  $f(x) = x \ln x$  by  $T_3(x)$ , the third degree Taylor Polynomial centered at  $a=1$ .
- 3 (b) Use Taylor's Inequality to estimate the accuracy of the approximation when  $x$  lies in the interval  $0.9 \leq x \leq 1.1$
- 2 (c) Use  $T_3(x)$  to approximate  $(1.01) \ln(1.01)$

(10 points)

$$T_3(x) = f(a) + f'(a)(x-a) + \frac{f''(a)(x-a)^2}{2!} + \frac{f'''(a)(x-a)^3}{3!}$$

$$f(x) = x \ln x \quad f(1) = 0$$

$$f'(x) = 1 + \ln x \quad f'(1) = 1$$

$$f''(x) = \frac{1}{x} \quad f''(1) = 1$$

$$f'''(x) = -\frac{1}{x^2} \quad f'''(1) = -1$$

$$f^{(4)}(x) = \frac{2}{x^3}$$

a)  $x \ln x \approx (x-1) + \frac{(x-1)^2}{2} - \frac{(x-1)^3}{3!}$

b)  $|R_3(x)| \leq \frac{f^{(4)}(c)(x-1)^4}{4!}$  for  $c$  between  $x$  and  $a=1$

Books "M"  
 $= \frac{2}{C^3} \frac{(x-1)^4}{24} \quad 0.9 \leq x \leq 1.1 \Rightarrow |x-1| \leq 0.1$

$= \frac{2}{C^3} \frac{(0.1)^4}{24}$  This is largest when  $c$  is small 

$\leq \frac{2 (0.1)^4}{(.9)^3 24} \approx 0.00001$

c)  $1.01 \ln(1.01) \approx T_3(1.01)$

$$= (1.01-1) + \frac{(1.01-1)^2}{2} - \frac{(1.01-1)^3}{3}$$

$$= .01 + \frac{(.01)^2}{2} - \frac{(.01)^3}{3} \quad .010049833$$

(Calculator: 0.010049833...)

double check  
should be at  
least within 0.0000
